

# Technology to support a more collaborative hospital workforce

**At Olinqua, we believe connected hospitals create more meaningful outcomes for everyone.**

That is why our hospital collaboration technology seamlessly facilitates the myriad of day-to-day information exchanges to keep a hospital running smoothly.

Clinicians and healthcare teams can text, chat, private message, share files and images — or choose to keep private — all in a secure environment which won't impact personal devices. Take a look at our Hospital Collaboration & Communications solution:

## **Secure clinical messaging**

User-friendly, simple and effective communications.

Olinqua's messaging solution facilitates the secure exchange of text communications between all platform users, including automated notifications from incoming data, system events and workflows.

This enables staff to create closed and secure message groups for support and assistance from peers, along with the ability to create speciality team groups for specific wards, floors or cases.

## **Effective task management**

Remain connected across the patient care continuum.

Olinqua's task management solution allows hospital managers to lead effectively through the live and collaborative allocation of operational and clinical tasks. Smart technology automates key status, responses and makes reporting simple to reduce overhead for individuals in their daily routines.

## **Secure and efficient media sharing and management**

Empowering clinicians to share and collaborate on the go.

Olinqua's media sharing capabilities allow for the secure storage and sharing of clinical images and documents. With collaborative access across teams, clinical communication is enabled and amplified.

## **Messaging Integration Engine: Powering a connected hospital workforce and environment**

Bridging clinical communication and collaboration gaps.

In order to deliver access to anywhere, anytime communications, through a single system, Olinqua has created an integrated and interoperable core clinical communications solution.

[hello@olinqua.com](mailto:hello@olinqua.com)

We call this a Messaging Integration Engine — facilitating the exchange of data between systems in one hospital and/or across different hospitals.

Olinqua's Messaging Integration Engine incorporates interrelated workflows and communication applications such as personal directories, nurse call and alert solutions, and mobile devices (including pagers) to automate the handling and dispatching of hospital messages and alerts.

The benefit of Olinqua's Messaging Integration is far-reaching. Through this installation, hospitals can also access:

- Real-Time Location System for Facility Monitoring
- AI-supported Asset Tracking
- Critical Incident Management
- Mobile And Fixed Alarm Duress For Staff Safety
